Robert L. Freie, State Statistician

Richard D. Gaskalla, Director

ACKNOWLEDGMENT

The inventory data contained in this report were developed at the request of and with funds provided by Florida's Citrus Industry. Its leaders sought accurate information for projecting future production and recognized the requirement to maintain citrus tree and acreage inventories on a current basis.

The work was directed by the Florida Agricultural Statistics Service who supervised photography, photo interpretation, field checking, and assembling of the data. Field survey work was a continuing cooperative project of the Florida Agricultural Statistics Service and the Division of Plant Industry.

Private and public officials contributed to this work by supplying information and other assistance. Many growers supplied basic data. These contributions are sincerely appreciated.

This public document was promulgated at a cost of \$9,299.45 or \$3.72 per copy to inform citrus growers and others of trends in Florida citrus production. M90T8

AERIAL PHOTOGRAPHIC SURVEY OF
FLORIDA CITRUS GROWING AREAS
 Florida Agricultural Statistics Service
 Florida Department of Agriculture & Consumer Services

SURVEY HIGHLIGHTS

The acreage of commercial citrus in Florida increased to 732,767 acres from 697,929 acres in 1988 despite the hard freeze of December 1989. This 5 percent increase in total acreage is largely attributed to the tremendous amount of new plantings in the Southern and East Coast areas.

There were 120,696 acres planted in 1988 and 1989. These new plantings were offset by 85,858 acres lost to normal attrition and the freeze. The 34,838 net gain in acreage is the third largest increase for the two year tree census period since the first Survey in 1966.

Hendry County, with an 18,801 net acreage increase in the past two years, leads all citrus producing counties in acreage gained. DeSoto was second followed by Highlands and St. Lucie. Hendry County's new plantings which are more closely set than older groves, increased more than 32 percent for the two year period. Lake County suffered the greatest acreage loss from the December 1989 freeze. Orange and Polk counties were a close second and third in losses.

ACREAGE CHANGE BETWEEN SURVEYS

The total tree inventory by year set as indicated in the Censuses of 1970 to 1990 is shown on page 109. From the record high 941,471

acres planted at the time of the 1970 survey, only 274,662 (29 percent) remain. The 1990 Census indicates that only 366,443 acres (43 percent) remain from the 845,283 reported in the 1980 Census. The gross acreage decline in the past two years is 12.3 percent (page 109) of the 1988 inventory.

1/ January freezes in 1971, 1977, 1981, 1982, and 1985. December freezes in 1983, 1985, and 1989.

SURVEY HISTORY AND PROCEDURES

This publication presents the results of the thirteenth biennial survey of Florida citrus trees using aerial photography. The use of aerial photography and photo interpretation provides for completion of a survey more rapidly than with other methods; even then, about eight months of intensive effort is required to process and review photographs. Changes in groves are detected by comparative photo interpretation, followed by field checking of new and altered acreages. Changes disclosed on photographs and in field observations are used to update the previous inventory. This application of proven technology provides current tree inventory data for evaluating Florida's potential citrus production within a shorter period of time and at less cost than by ground survey methods alone.

The Florida Agricultural Statistics Service first began indexing citrus groves on aerial photography with the January, 1966 survey. The 1966 inventory report included detailed data by county, variety, and year set; and the survey was designed for quick and economical updating. Subsequent surveys, using aerial photography, were conducted as of January every two years including the latest for 1990.

AERIAL PHOTOGRAPHY

The same three-mile wide flight lines established for the January 1966 survey were photographed on each of the succeeding flights. Some additional coverage has been added as citrus acreage has extended farther south. The area, photographed at a scale of 1 inch to 2,500 feet, now covers almost 14,000 square miles and includes more than 99 percent of the commercial citrus acreage in Florida. Photographing for the latest survey began the first of November 1989 and was completed by the end of March.

NON-PHOTOGRAPHED AREAS

Flight lines are laid out for maximum grove coverage at minimum cost. Since it is not economically feasible to photograph the few hundred scattered acres of outlying citrus, supplemental photography has been purchased, where available. In the absence of photography, the outlying acreage was mapped and thoroughly checked by ground survey teams.

For quality control and to locate any newly established groves, a light airplane was used to fly those areas of the citrus belt not actually photographed.

PHOTO INTERPRETATION

Stereoscopic viewers enabled interpreters to examine two photo contact prints simultaneously, to detect changes occurring during 1988 and 1989. Altered ground characteristics result in a loss of the three-dimensional effect, making such changes as new groves, additions to existing groves, pushed groves, and other significant alterations quickly identifiable. In addition to stereo examination, a light table

was used to visually compare replacement cronaflex enlargements with the previous master transparencies on which groves are delineated. Questions, based on the observable changes, were formulated for field inspection.

FIELD INSPECTION

On January 8, 1990, field crews began ground checking sites that had been questioned by photo interpreters on the new photography. All blocks showing changes since the 1988 flight were visited. Crews identified varieties in blocks where trees were too young in earlier surveys. Field work was completed the last week of July.

GROVE INDEXING

Following field inspection, photo interpreters delineated and indexed all new citrus groves and grove changes by variety blocks on cronaflex enlargements of aerial photographs. Digital planimeters were used to measure acres of new and altered citrus groves. Acres were computed from the combination of tree numbers and tree spacings as measured by field personnel. All statistical information (variety, year set, acreage, tree numbers and identifying features) was then keyed into a data base and retained for future use.

There are approximately 137,000 variety blocks, all of which were summarized by computer and retained on magnetic tape. The computer then produces a camera-ready copy of the printed tables.

COMMERCIAL GROVES, MINIMUM 50 TREES

The data in this report relate to commercial groves, those containing a minimum of 50 trees from which fruit is generally sold. In addition, the grove must have been cultivated and, if cold damaged, have viable growth in the limb scaffold.

NET ACRES IN COMMERCIAL GROVES

The acreage shown is land which is actually planted with citrus trees. Bayheads, ponds,

sinkholes, drainage canals, lateral and swale ditches, roads, turn rows and wide middles were excluded. Where vacancies within a commercial grove were numerous, they were counted and acreage was then reduced to equivalent net acres of commercial trees. These groves will be revisited in subsequent censuses to determine acreage reset.

CHRONOLOGICAL AGE USED

Trees are listed by the calendar "year in which set," even though they may have been severely pruned. Grove managers' records were used, when available, to establish age. Age of young trees is estimated from both trunk circumference and tree height.

RESET TREES

The photo interpreters identify all groves where there appear to be new trees. These groves are then visited by ground crews. If the inspector finds a significant number of new trees, a count is made and the older trees or vacancies reduced accordingly. Based on this new count of trees, the measured block acreage is then divided between the two ages of trees.

INTERSET AND MULTI RESET BLOCKS

In blocks of citrus which are intersets, acreage is proportionate to the number of trees of each variety or type, and/or age in the block. In the multi reset blocks, two or more resets are planted in one location for each tree removed. Because of the variable distance between trees the spacing must be averaged. The spacing between rows in one direction remains constant for grove travel.

UNIDENTIFIED TREES

Identification of citrus varieties generally depends on the presence of fruit. Many young groves visited for the first time are indexed as unidentified until fruit is available for variety determination. Acreage and trees in

this report listed as "unidentified" will be resurveyed and classified by variety in the next census.

The unidentified trees and acres are listed by year set and by county under all Florida citrus. They are also included in the all orange or all grapefruit totals.

OTHER CITRUS

Data itemized under the heading of other citrus include minor types and varieties, such as Ponkans, Satsumas, K-Early Citrus, Kumquats, etc. They are not reported individually or by year set within county due to lack of space.

ZERO ACRES AND TREES

The various tables in this report were computer summarized and printed. Variety totals were computer rounded to the nearest acre and one hundred trees. All item totals that fell below these parameters were listed as zeros. For this reason, users are cautioned that zero cells in the data tables could actually have a positive entry, but would be less than one half acre and below 50 trees.

PLANT INDUSTRY ASSISTANCE

Much of the credit for the completion of this survey goes to the Division of Plant Industry, which supplied eight trained citrus technologists with 4-wheel drive vehicles to work on the tree census field inspection team. Assistance was also provided by personnel from the Division of Fruit and Vegetable Inspection.

POST SURVEY TREE COUNTING

Resurveying is a continuing process between flights. Quality checks for accurate variety counts will be emphasized as well as the identification of the three year old plantings that are to be included in next year's objective count surveys. Also, all groves that had vacancies this past survey will be visited prior to the 1992 flight.
